Industrus Engineering
Graduate Recruitment
Australia

Application: Graduate Engineer Program

Dear recruiting team,

I am a final year Mechanical Engineering student at UTS, currently working as a Product Design Engineer at Inventor Group. I am applying for the Graduate Engineer position at Industrus Engineering. Rotating across consulting projects of the scale and variety you described, from renewable energy infrastructure to transport recovery planning, is the kind of broad engineering experience I want early in my career.

During my internship at Xero Linear Lighting Systems I produced manufacturing drawings and BOMs reviewed by global clients before going to production. I took that responsibility seriously, knowing that an error leaving the office could cause problems downstream. On more than one occasion I caught and corrected documentation issues before they reached the client, choosing accuracy over speed. That experience shaped how I think about accountability in engineering work generally.

Outside of my studies I volunteer as a developer for FreeCAD, an open-source CAD program. Contributing to a live codebase used by engineers worldwide has meant communicating across very different audiences, writing code that experienced C++ developers will review, and translating feedback from non-technical users into practical changes. At Inventor Group I have continued developing this skill through direct client work across a range of industries, where being able to explain technical decisions clearly to people without an engineering background has been just as important as the engineering itself.

A tendency I have noticed in myself is that I find it hard to walk past a problem without doing something about it. During my internship I noticed the process for generating drawing pages in Rhino3D was entirely manual and taking up to an hour per job. I wrote a Python script to automate it, bringing that down to under a minute. Nobody asked me to, and the script is still being used by the team today.

For my capstone project I built an automated DFM workbench for FreeCAD that analyses 3D geometry against injection moulding manufacturing rules, detecting undercuts, draft angles, wall thickness violations and sharp corners before parts go to production. This involved researching manufacturing standards, translating them into computational logic using Python and the OpenCASCADE kernel, and presenting results clearly to end users. Managing a technically complex, self-directed project over an extended period taught me a lot about staying organised and keeping momentum without external deadlines pushing me along.

At Inventor Group I work across product development projects with clients, industrial

designers and manufacturing partners. In a small consultancy there is no room for ambiguity about who owns what, so I have learned to be clear about scope, proactive in flagging issues early, and dependable when it comes to delivery.

I have attached my resume and look forward to hearing from you.

Yours sincerely,
Ryan Kembrey
